AIX-MB-19 Applications of Artificial Intelligence and Machine Learning for Wireless Networks

Module code	AIX-MB-19
Module coordination	Prof. Dr. Andreas Kassler
Course number and name	AIX-MB-19 Applications of Artificial Intelligence and Machine Learning for Wireless Networks
Lecturers	Khalid Ali Felix Dsouza Prof. Dr. Andreas Kassler Nathalie Romo-Moreno
Semester	1, 2
Duration of the module	2 semester
Module frequency	as required
Course type	compulsory course
Level	undergraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	
Language of Instruction	English

Module Objective

Upon completion of the course, students should be able to:

- explain the principles and limitations of wireless communication,
- explain important technical aspects of current wireless communication systems,
- compare and contrast different wireless communication systems based on an understanding of shared challenges (such as mobility management),

- understand what are the different ML use cases in different layers of the protocol stack from the physical layer to the application layer
- perform a literature review on the application of machine learning in wireless networks.

Entrance Requirements

Students should have basic understanding of computer networks.

Learning Content

The course is separated into two parts.

The first part gives an introduction to the principles of mobile and wireless, including the function and operation of modern mobile and wireless communication systems and networks related to architecture, protocol, security, and algorithms. Current wireless systems, such as cellular systems (2G, 3G, 4G, 5G) and mobile Internet, including the WLAN standard IEEE 802.11, are used as examples to explain these principles. The set of introductory lectures cover the following:

- Radio signals
- Coding, modulation, and multiplexing
- Medium access
- The basic principles of cellular systems (e.g. 2G, 3G, 4G, 5G) and wireless networks including WLAN (e.g. WiFi) and WPAN (e.g. Bluetooth)

In the second part, the students perform an individual literature review on the application of machine learning in wireless networks on a relevant topic. The steps to accomplish the literature review project are as follows:

- A. Select a topic relevant to the application of ML in wireless networks and register it by email
- B. Search for the relevant papers and make a list of papers
- C. Study the papers and prepare a summary
- D. Present the outcomes in a seminar style presentation (between 30 and 45 minutes)

Each student should present her/his research study in an intermediate and a final presentation. A summary paper should be written following the survey papers guideline using IEEE format.

Exemplary topics can be

- ML use cases in physical layer of cellular networks
- ML use cases in MAC of cellular networks
- ML use cases in higher layer of cellular networks
- ML use cases in vehicular networks, 5G-V2X
- Intelligent wireless networks
- Cognitive radio networks
- ML use case in wireless networks

- Standardization activities on AI-enabled wireless networks
- ML use-cases for network slicing
- ML use-cases for OpenRAN
- ML use-cases for Software-Defined Networks

The grade will be composed of different components:

- 30% written exam for the lecture part
- 30% final presentation
- 40% survey paper

HPC-07 HPC/QC Technology

Module code	HPC-07
Module coordination	Prof. Dr. Helena Liebelt
Course number and name	HPC-7 HPC/QC Technology
Lecturer	Prof. Dr. Helena Liebelt
Semester	1
Duration of the module	1 semester
Module frequency	annually
Course type	required course
Level	postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written assignment (StA)
Weighting of the grade	5/90
Language of Instruction	English

Module Objective

In this module, students delve into the intricacies of High Performance Computing (HPC) and/or Quantum Computing (QC) systems, gaining a comprehensive understanding of the technological challenges specific to these cutting-edge fields. Through a blend of theoretical learning and hands-on experience, students familiarize themselves with the hardware technologies essential to these domains. Through practical sessions, they acquire invaluable skills in system assembly and configuration, empowering them to proficiently set up components of modern HPC systems. Additionally, students learn the nuances of system installation and configuration on a smaller scale, equipping them with the capability to effectively deploy and manage these advanced computing systems.

Professional skills

Professional Skills: Students develop a range of professional skills essential for success in the field of High Performance Computing (HPC) and/or Quantum Computing (QC) systems. They refine their ability to analyze complex technological issues specific to these domains, employing critical thinking and problem-solving techniques to address challenges effectively. Through hands-on experience in system assembly and configuration, students enhance their technical proficiency, ensuring they are adept at deploying and managing modern HPC systems. Furthermore, students cultivate strong communication skills, enabling them to articulate their ideas and solutions clearly to peers and industry professionals.

Methodological skills

This module hones students' methodological skills, providing them with a structured framework for approaching problems in HPC and/or QC systems. Students learn systematic approaches to system setup, installation, and configuration, ensuring precision and efficiency in their work. They develop robust methodologies for troubleshooting and debugging, equipping them with the ability to identify and resolve issues promptly. Additionally, students learn to conduct thorough research, staying abreast of the latest advancements in hardware technologies relevant to the field.

Social skills

In addition to technical expertise, students refine their social skills, recognizing the collaborative nature of the HPC and/or QC ecosystem. Through group projects and collaborative tasks, students learn to work effectively as part of a team, leveraging each other's strengths to achieve common goals. They develop interpersonal skills such as active listening, constructive feedback, and conflict resolution, fostering a positive and productive team dynamic. Furthermore, students engage in networking opportunities with industry professionals, enhancing their ability to build and maintain professional relationships within the field.

Personal skills

This module also focuses on the development of personal skills essential for professional growth and success. Students cultivate traits such as adaptability and resilience, learning to navigate the dynamic landscape of HPC and/or QC systems with confidence. They hone their time management and organization skills, balancing academic coursework with hands-on practical sessions effectively. Additionally, students foster a growth mindset, embracing challenges as opportunities for learning and growth. By prioritizing self-reflection and continuous improvement, students develop into well-rounded individuals prepared to excel in the rapidly evolving field of high-performance computing.

Applicability in this and other Programs

Hardware / system design for complex modern computing systems

Entrance Requirements

Prerequisites for this module on a master's level would typically include:

1. **Foundational Knowledge in Computer Science or Related Field:** Students should have a solid understanding of computer science fundamentals, including data structures, algorithms, computer architecture, and operating systems.
2. **Programming Proficiency:** Proficiency in at least one programming language commonly used in high-performance computing, such as C/C++, Python, or Fortran, is essential. Students should be comfortable writing, debugging, and optimizing code.
3. **Mathematical Background:** A strong background in mathematics, particularly in areas such as linear algebra, calculus, and probability theory, is necessary for understanding the underlying principles of high-performance computing and quantum computing.
4. **Understanding of Parallel Computing Concepts:** Familiarity with parallel computing concepts and techniques is crucial, including parallel algorithms, parallel programming models (e.g., MPI, OpenMP, CUDA), and parallel computing architectures.
5. **Basic Knowledge of Hardware Systems:** Students should have a basic understanding of computer hardware components and architecture, including processors, memory systems, storage devices, and networking.
6. **Prior Experience with Operating Systems:** Familiarity with operating systems concepts and administration is beneficial, as students will be involved in setting up and configuring computing systems.
7. **Experience with Command-Line Interface (CLI) Tools:** Proficiency in using command-line interface tools and Unix/Linux operating systems is important for executing commands, managing files, and interacting with the computing environment.
8. **Probability and Statistics:** Some familiarity with probability and statistics is advantageous, especially for students interested in quantum computing, as it provides the foundation for understanding quantum algorithms and quantum information theory.
9. **Critical Thinking and Problem-Solving Skills:** Strong critical thinking and problem-solving skills are essential for analyzing complex technological issues and developing effective solutions in the context of high-performance and quantum computing systems.
10. **Research Skills:** Students should possess basic research skills, including the ability to gather, evaluate, and synthesize information from academic literature, technical documentation, and online resources related to high-performance and quantum computing.

These prerequisites ensure that students have the necessary background knowledge and skills to fully engage with the advanced topics covered in the module and to successfully complete hands-on practical sessions and assignments.

Learning Content

The aim of this course is to discover the technological particularities of HPC and QC systems.

The module is divided into two parts, both covering theoretical as well as practical aspects including hands-on sessions:

- Hardware
 - Setting up a compute node
 - Rack technologies
 - Cooling aspects
- Software
 - Setting up an operating system
 - Middleware
 - Access and scheduling

Teaching Methods

AIX-M-2 Datacenter Network Programming

Module code	AIX-M-2
Module coordination	Prof. Dr. Andreas Kassler
Course number and name	AIX-2 Datacenter Network Programming
Lecturer	Prof. Dr. Andreas Kassler
Semester	2
Duration of the module	1 semester
Module frequency	annually
Course type	compulsory course
Level	
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 90 hours self-study: 60 hours Total: 150 hours
Type of Examination	written ex. 90 min.
Duration of Examination	90 min.
Weighting of the grade	5/210
Language of Instruction	English

Module Objective

Students acquire understanding and hands-on experience of how the data plane of modern datacenter networking equipment can be programmed using the high-level and popular programming language P4 (see <http://p4.org>). They learn the basic concepts of the P4 language and understand, how offloading simple computational tasks to the data plane of programmable networking devices (such as datacenter routers or network cards) can be used to speed up the performance of Deep Learning, Big Data Analytics use-cases within modern datacenters. They understand, how the data plane can be used to accelerate distributed high-performance computing (HPC) building blocks including distributed key-value stores, where load-balancing and network monitoring of the datacenter networking fabric is important for achieving high speed and low latency.

They setup their own development environment in the network emulator Mininet and implement simple data plane programs in the P4 language. They know how to use P4 to parse packet headers, apply different actions and modify packets before forwarding them. They know basic P4 constructs, how to store stateful information (e.g. parts of a neural network) and how to perform simple computational tasks in the data plane.

Based on this knowledge and understanding, students implement a small-scale project in a team. They use their acquired knowledge on P4 and programmable datacenter networking. They evaluate the results of other project groups and get evaluated by other groups. For this project work, they have used standard tools (Mininet, P4 toolchain, command line interface) for programming the data plane of an (emulated) datacenter router.

After finishing this module, students can design, implement and evaluate their own P4 programs using the network emulator Mininet.

Specifically, students will have achieved the following outcomes upon completion of the module:

Subject competency

Students understand the significance of datacenter network programming and how datacenter network programming can be used to improve the performance of distributed high-performance applications such as distributed training and inference of large-scale ML models.

Methodological competency

Students select the most appropriate P4 constructs for solving a concrete practical problem and use it to implement a concrete use-case of a data plane program.

Personal competency

Students understand complex theoretical concepts and apply them to problems arising in practice.

Social competency

Students communicate clearly, argue and criticize logically and constructively, contribute to reasoned, team-oriented problem-solving processes in the group.

Applicability in this and other Programs

This Module is suitable for the following programs:

- Master in Angewandte Informatik/Infotronik
- Master in Artificial Intelligence and Data Science
- Master in High Performance Computing/Quantum Computing

Entrance Requirements

Students should have basic understanding of Network Technologies and/or Communication Networks. Basic knowledge of Programming and basic knowledge in Python helps in the Project Part of the course.

Learning Content

The Module is decomposed into two parts:

Part I: ?Introduction to Datacenter Network Programming? and Part II ?Project in Datacenter Network Programming?

Content Part I:

(1) Introduction to Programming the Data Plane of a Datacenter networking device:

- Difference between Data and Control Plane
- Introduction to P4 language
- P4 programming model
- Compiling and deploying P4 programs
- P4 Targets: Behavioral Model (BMv2), Programmable Switching ASIC Intel Tofino, Mellanox Bluefield DPU, Netronome SmartNIC
- Basic P4 concepts: header parsing, applying tables and actions, header rewriting.
- Workshop: Setup Development environment with Mininet and Command Line Interface (CLI), implement, test and debug simple P4 language constructs and programs using the Mininet network emulator

(2) Datacenter Networking and Load Balancing:

Faculty Computer Science

Artificial Intelligence and Data Science

Date: 22.11.2022

- Datacenter networking fundamentals, routing and forwarding within the datacenter networking fabric
- Workshop: Advanced P4 concepts: stateful information, register arrays, counters and meters.
- Loadbalancing in Datacenter networks, Equal Cost Multipath Routing, Conga, Hula
- Workshop: Implementing ECMP in P4
- (3) In Network support for Monitoring and Caching:
 - Active and passive network monitoring
 - Inband Network Telemetry (INT) for fine-granular network monitoring
 - Accelerating Distributed Key-value stores in the data plane of the data center
 - Using telemetry for fine-grained loadbalancing
 - Workshop: Implementing Hula and INT in P4
- (4) In Network support for Distributed Machine Learning:
 - Role of the datacenter network for distributed training and inference
 - In network support for Distributed Machine Learning Inference for in-switch traffic classification

- Mapping trained machine learning models (decision trees, SVMs, neural networks) to programmable data plane devices
- In network support for distributed training within a datacenter network

Content Part II:

Project: Implementation of your own small dataplane program in P4 and testing it in the Mininet network emulator.

Teaching Methods

- Interactive lectures
- Practical workshop style exercises using the network emulator Mininet
- Software implementation of your own P4 program

Remarks

The module is comprised of two parts. The second part (project work) can be done in groups of max. 3 students.

Recommended Literature

Recommended Literature will be provided at the start of the course by a set of research and practical oriented articles that are available online.

AIX-M-16 ChatGPT et al.: Generative AI with Transformers

Module code	AIX-M-16
Module coordination	Prof. Dr. Andreas Fischer
Course number and name	AIX-M-16 ChatGPT et al.: Generative AI with Transformers
Lecturers	Zineddine Bettouche Prof. Dr. Andreas Fischer
Semester	2
Duration of the module	1 semester
Module frequency	annually
Course type	compulsory course
Level	
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	written examination
Weighting of the grade	
Language of Instruction	English

Module Objective

Entrance Requirements

AIX-M-16 ChatGPT et al.: Generative AI with Transformers

Entrance Requirements

Substantial background in artificial intelligence

Learning Content

The module will give an introduction to the transformer technology which drives modern large language models. Covered topics are:

- Foundations of Language Models
- Word Embeddings
- Attention Mechanism
- Architectures of Transformer Models
- Popular Open Source Transformer Models
- Limitations of Large Language Models
- Applications of Transformers in and beyond NLP
- Optimization of Transformer Models

Type of Examination

written student research project

Methods

Seminaristic education

MAI-03 Selected Topics of Embedded Software Development

Module code	MAI-03
Module coordination	Prof. Dr. Manfred Vielberth
Course number and name	03 Selected Topics of Embedded Software Development
Lecturer	Prof. Dr. Manfred Vielberth
Semester	1, 2
Duration of the module	2 semester
Module frequency	annually
Course type	required course
Level	Postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 30 hours self-study: 30 hours Total: 60 hours
Type of Examination	Portfolio
Weighting of the grade	5/90
Language of Instruction	English

Module Objective

The student acquires basic knowledge and skills in automotive ethernet communication and embedded security, structures, and reasoning. The student is competent to apply structured thinking and engineering thinking.

Technical Competences

Students know the abstract concept of networking layers and their application in real-world hardware.

They are able to analyze and troubleshoot network communication issues in automotive/ embedded environments

They apply critical thinking in evaluating different automotive network technologies

They are able to define virtual networks and interact with physical networks.

Methodical Competences

Students learn to systematically map and structure automotive network protocols according to the OSI model, enabling them to categorize and analyze communication technologies efficiently. They apply a structured approach to implementing and testing network configurations in automotive applications.

Students are able to decide on the application of different analyzers in an embedded (networking) environment.

Personal Competences

Students obtain the ability to analyze and troubleshoot network communication issues in automotive environments. They will enhance their critical thinking skills by evaluating different automotive network technologies and their applications.

Applicability in this and other Programs

Module can be used in other degree programs, e.g. as a subject-specific elective module (FWP)

Entrance Requirements

Fundamentals of network technology and security

Learning Content

OSI-model

Automotive data communication architecture

Standard IP protocols

Automotive Ethernet physical layer

Data Link Layer: VLAN, TSN, AVB

Automotive application layer / SOME/IP

lab work at automotive multimedia gateway

Teaching Methods

Lectures in form of seminars and practical exercises

Remarks

03 Selected Topics of Embedded Software Development

Type of Examination

part of module exam

LSI-12 Data Visualization

Module code	LSI-12
Module coordination	Prof. Dr. Javier Valdes
Course number and name	LSI-12 Data Visualization
Lecturers	Prof. Dr. Phillipp Torkler Prof. Dr. Javier Valdes
Semester	2
Duration of the module	1 semester
Module frequency	annually
Course type	required course
Level	Postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 45 hours virtual learning: 45 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5/90
Language of Instruction	English

Module Objective

Data Visualization is the graphic representation of a data analysis to achieve clear and effective communication of results and insights. Complex ideas are presented in charts and graphs with the goal of quickly and easily disseminating key, actionable information. Data visualization is an essential part of data science and analytics, especially when working with large, complicated data sets like sequencing data. The visualization tells a story, whether as a stand-alone graph or combined with other graphs, charts and design elements in an infographic or dashboard.

After completing the Data Visualization module, students will have obtained the following learning competencies:

Professional competence

After successfully completing the module, students will:

- know the data visualization principles.
- be familiar with file formats and their usage in the different analysis approaches.
- know about common data analysis workflows and be able to interpret and visualize the achieved results.

Methodological competence

After successfully completing the module, students will:

- know how to use ggplot2 in R to create custom plots.
- know how to use matplotlib and Python to create custom plots.

Social competence

- Interdisciplinary and interpersonal collaboration when working together in small groups on developing R and Python scripts for data analysis and data visualization.
- Working together with fellow-students in small groups on designing and developing biostatistical validation of biomedical datasets within R and/or Python.

Applicability in this and other Programs

master seminar, master thesis

Entrance Requirements

Recommended or advantageous:

Basic Knowledge in R

Module: LSI-04 *Biostatistics I*

Learning Content

- 1 R Packages for data visualization
- 2 Open access visualization tools
- 3 Matplotlib and other Python packages for data visualization
- 4 Theoretical Background
- 5 Perception And Interpretation

Teaching Methods

Tutorial, practical exercises, application examples

The module consists of an interactive theoretical part with blended learning components. Within the tutorial the students use example NGS datasets to perform the biomedical data visualization. In the practical part of the tutorial the students should learn to find various visualization tools, possibilities and methods and discuss their advantages and disadvantages to represent statistical significance.

Remarks

The iLearn teaching and learning platform provides students with additional literature references and learning material to prepare for the lectures.

Recommended Literature

Detailed lecture notes are available online for preparation and follow-up work

MAI-11 FPGA Programming

Module code	MAI-11
Module coordination	Prof. Thomas Limbrunner
Course number and name	MAI-11 FPGA Programmierung
Lecturer	Prof. Thomas Limbrunner
Semester	1, 2
Duration of the module	2 semester
Module frequency	annually
Course type	required course
Level	Postgraduate
Semester periods per week (SWS)	4
ECTS	5
Workload	Time of attendance: 60 hours self-study: 90 hours Total: 150 hours
Type of Examination	Portfolio
Weighting of the grade	5/90
Language of Instruction	English

Module Objective

Technical Competences

Students can implement small circuits using programmable hardware devices.

Students gain insight into hardware-level programming and design

Methodical Competences

Students are able to apply tools for FPGA programming and use them to implement a small project

Personal Competences

Students discover system architectures on a hardware-near level

Applicability in this and other Programs

-

Entrance Requirements

- Fundamental programming tools (e.g. control flow, data structures, functions)
- Digital logic (e.g., transistor, logic gate, K-map, SOP, multiplexer, counter,)
- Typical controller architecture (e.g., ALU, memory, peripherals,) The course provides also an introduction to digital logic so you can still attend the course if you do not have any experience with digital logic.

Learning Content

- Typical structure of FPGAs
- Fundamentals about the FPGA tooling
- Introduction into VHDL
- Combinational logic
- Sequential logic
- State machines
- Memory
- Selected specific design aspects and application scenarios of FPGA technology

Teaching Methods

To reach the learning outcomes we will use the following didactic methods:

- Seminar-based teaching with many practical exercises (evaluation in a simulative environment as well as testing on target hardware)
- Self-reliant implementation of compact projects.
- Optional Flipped Classroom

Remarks
